

Thank you for the review. Below are the answers to all seven items. The same summary has been added to the Notes field in App Review Information.

****1. Screen recording****

A screen recording captured on a physical Mac running the latest macOS is attached. It starts with launching the app and shows, in order: launch (the app intentionally has no Dock icon), account registration with an emailed code, sign-in with a password, creating a room, an audience member joining from a phone browser and posting comments, stamps and an uploaded image stamp, the overlay running on top of a full-screen presentation, the content filter, reporting, "Hide & block", removing a reported image stamp, the in-app purchase and restore flow, the optional Screen Recording permission with the "● REC" indicator, and account deletion.

****2. Purpose and target audience****

LayerTalk lets an audience react to a live presentation, and shows those reactions on top of the presenter's slides. Comments, stamps and questions fly across the presentation display in a click-through, always-on-top overlay, so they appear over Keynote, PowerPoint, Google Slides, Canva or Notion in full screen without any plug-in for those apps. The problem it solves: at meetups, lectures, training sessions and webinars, audience feedback either does not happen at all or lives in a separate chat window that the presenter cannot watch while presenting, and that the audience must install an app or create an account to use. With LayerTalk the audience opens a URL from a QR code or a six-character code in any mobile browser, with no installation and no account, and the presenter never has to leave the slides. Target audience: speakers and organizers at technical meetups and conferences, in-house study sessions and corporate training, university lecturers, and webinar hosts. The age rating is 13+.

****3. Setting up and accessing the main features****

Demo account (presenter):

Email: layertalk0816+appreview@gmail.com

Password: (see the Notes field in App Review Information)

On the sign-in screen, choose "Sign in with a password" and use the credentials above. The default method emails a six-digit code; the password option exists so that you do not need access to a mailbox. There is no separate sign-up screen: entering a new email address and confirming the code creates the account. No sample files are required.

Steps:

1. Launch LayerTalk. It uses the Accessory activation policy so the overlay never steals focus from the presentation app, so there is no Dock icon. The control window opens at launch; you can reopen it from the LayerTalk menu bar icon or with Shift-Command-L.
2. Sign in with the demo account, then tap "Create room" to create a new room. New rooms start with a default blocked-word list.
3. On a phone or a second browser, open the audience URL shown under the room code (<https://www.layer-talk.com/r/<CODE>>), then post a comment or tap a stamp.
4. In the control window, tap "Start presentation". Comments and stamps now fly across the selected display, over whatever is on screen. Anything posted before you start is intentionally not shown, so rehearsal traffic never reaches a live slide.
5. If you do not have a second device, use the test comment and test stamp buttons in the control window.

The interface is available in Japanese and English; use the JA/EN toggle in the control window title bar.

Account deletion: control window, bottom, "Delete account". It is hidden while a presentation is running so the dialog cannot open in front of a live slide.

****4. External services used for core functionality****

- Supabase (hosted Postgres, Realtime, Authentication and Storage; Tokyo region)
 - presenter accounts (email one-time code or password), anonymous authentication for audience members, rooms, comments, questions, reports, and storage of audience-uploaded stamp images.
- Vercel - hosts the audience web app at <https://www.layer-talk.com> and our server API (purchase verification, account deletion, scheduled data cleanup).
- Apple - StoreKit 2 for the in-app purchase, and the App Store Server API and App Store Server Notifications V2 for verifying and revoking it. This is the only payment path in this app.
- Optional, configured by the user: Slack Incoming Webhooks and Microsoft Teams Workflows. This is off by default and only active if the presenter enters their own webhook URL. Only the room's join URL and a fixed invitation text are sent, directly from the Mac. Webhook URLs are stored in the macOS Keychain and are never uploaded to our servers.
- We use no AI services, no advertising networks, no analytics or tracking SDKs, and no third-party data providers.

Stripe also appears on our website, because a separately distributed direct-download version of LayerTalk sells the pass there. The App Store build never reaches it: purchases go through StoreKit only, and the legal pages opened from the App Store build are served in an App Store variant that contains no Stripe or other external purchase information. We verify this for every build we submit.

****5. Regional differences****

The app functions consistently across all regions. There are no region-locked features, no region-specific content, and no regional pricing differences beyond Apple's own price matrix (the Event Pass is based on JPY 2,980 in Japan). All users are served by the same backend in Supabase's Tokyo region. The interface and the legal pages are available in Japanese and English; the language is chosen by the presenter inside the app, not by region or device locale, and the audience web app follows the language of the room they join. Our DSA trader information was submitted on 2026-09-21 and is still under review.

****6. Regulated industry and third-party material****

LayerTalk does not operate in a regulated industry and includes no protected third-party material. All artwork, the app icon and the text are ours; the app uses system fonts only and bundles no licensed content. Stamps are system emoji plus images uploaded by the audience, which are user-generated content covered by the safeguards below. The names of other presentation apps appear in our description only to say which apps LayerTalk can be used over, with a trademark notice.

****7. In-App Purchase****

There is one product: LayerTalk Event Pass (app.layertalk.presenter.event_pass), a non-renewing subscription that gives one room seven days of the paid features. It does not renew automatically and is never charged again unless the presenter buys another pass. It unlocks: approval mode (questions are held until the presenter approves them)

a room passcode, a post-presentation report, and branding (own logo, and hiding the LayerTalk mark).

Everything else is free and unlimited, including all of the Guideline 1.2 safeguards: the blocked-word filter, the report button on every comment (a long press on custom image stamps), "Hide & block", which removes the comment and bars that participant from re-entering the room, a switch that turns off custom image stamps entirely, our Terms, and the contact address layertalk0816@gmail.com. We review reports of objectionable content within 24 hours, remove content that breaks the Terms, and bar the user who posted it. How to reach the purchase: control window, sign in, create or open a room, then

the "Event Pass" section, and tap "Buy pass". The StoreKit sheet opens there. To restore, tap "Restore purchases" in the same section; the app reads the customer's StoreKit transaction history, re-verifies each signed transaction on our server, and re-applies any pass still within its seven-day window. The app contains no other purchase path and never links to an external purchase.
